1. Motivation

GCompris is a high-quality educational suite which aims at making learning easier for children aged 2 to 10. GCompris currently has 137 activities on various topics such as science, maths, games with which it has successfully created a great learning environment for children. However, there are few activities which were started previously but is not yet complete. I strongly believe in what GCompris stands for and in this project, I aim at taking GCompris one step forward by finishing three started activities: *Pilot a Submarine*, *Family* and *Digital Electronics*

2. Project Goals

By the end of the Google Summer of Code's time period, I will be completing the following started activities:

• Pilot a Submarine: It is a port to the Qt version of a strategic activity originally present in the Gtk+ version aimed to teach how a submarine works. It was started in this branch:

https://cgit.kde.org/gcompris.git/log/?h=gsoc-submarine

The activity needs to be started from scratch, since not much advancement has been made in the branch

• **Family**: It is an activity to help children understand how they are related to their relatives. It was started in the branch:

https://cgit.kde.org/gcompris.git/log/?h=GSoC-family

GSoC KDE 2017 March 28, 2017

The core implementation of this activity is complete, but improvements needs to be done on the design

• **Digital Electronics**: This activity is aimed at providing a real time simulation of an electric circuit. It was started in the branch:

https://cgit.kde.org/gcompris.git/log/?h=gsoc-pulkit-digital-electricity

A Free Mode already exists, levels and tutorials needs to be added to allow children to understand and use the components properly

3. Implementation Details

3.1. Pilot a Submarine

The "Pilot a Submarine" is to learn how a submarine works, explaining the usage of elements such as engine, rudders and air tanks, in order to navigate a submarine to a required depth. It was originally started in the gsoc-submarine branch, but not much advancement has been made. So it needs to be started from scratch.

Main Goals:

- Since this activity was already present in the Gtk+ version, I will be using the svg and the audio files from the resources used in the Gtk+ submarines activity. This will allow me to dive into the coding part directly.
- I will be using box2d for the simulation and handling physics and collisions
- There will be a tutorial at the start of the activity, which will give a brief description about the different elements (engine, rudders and air tanks) and it's functions.
- Firstly I will be implementing the submarine and the mechanics of its elements, namely the engine, rudders and the air tanks. Once that is in place, I will start creating various levels and it's variations.
- The aim is to make the activity easy for children to understand. For achieving this, the levels should start from the very basics. The implementation is divided into two parts:

- the initial levels, which are aimed at giving a basic understanding of the use of different elements required to control a submarine. For example, the first level will explain the use of engines of a submarine and will ask the user to move from one point to the other by using the engine only. Similarly, the next levels will focus on using the ballast tanks, rudders and other elements of a submarine
- the latter levels will use the concepts from the initial levels in various forms to check whether the child has fully understood the mechanism of controlling the submarine or not
- The activity will contain pickups in the form of jewels, as it was present in the Gtk+ version
- Besides the regular pickups in the Gtk+ version, there will be additional threats in the form of rocks and caves, in order to maintain an increasing difficulty curve, while still keeping it doable for children within the prescribed age limit.
- In order to enhance the experience, the overall activity and the movement of the submarine and the animations will be smoother compared to the Gtk+ activity.

Figure 1: Submarine Activity

Extended Goals:

• I will look forward to improve the controls of the submarine, to make it more intuitive for the children to understand and use

3.2. Family

The core implementation of the family activity is finished. The layout of the activity needs to be improved.

Main Goals:

- The layout of the activity will be improved, keeping same generation members in the same level in the tree representation, making the relation easy to understand
- Cleaning up the code: including but not limited to removing redundant variables, separating the main working code and the dataset, keeping them in different files

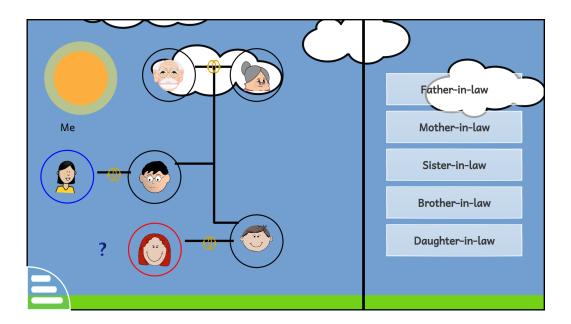

Figure 2: Current layout of the Family Activity

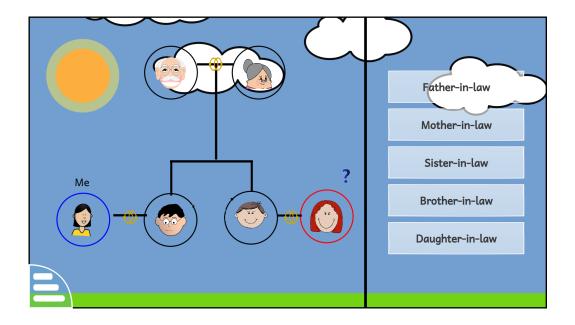

Figure 3: Sketch of the Final layout of the Family Activity

Extended Goals:

- In the existing activity, for a given pair, the user will have to choose the correct relation. There will be one more activity besides the existing activity
- In the new activity, which will inherit the existing activity, a relation will be provided and the child will have to click on the correct pair which demonstrates the given relation

3.3. Digital Electricity

The core simulation of electricity is done and the circuits are working properly. There exists a "Free Mode" where the children can use any component to build a circuit and test it on their own. But to make sure it is easier for the children to understand it, we have to illustrate how each of the components works in a circuit via properly designed levels and instructions. For this project, I propose:

• There will be levels to teach the children on how to use the components. These levels are broadly divided into three parts: The first part will be a very basic one: the aim will just be to learn how to use the component. For example, if the component is the Or Gate, the child will be asked to light the bulb using the "1" and "0" input, or with two "1" inputs.

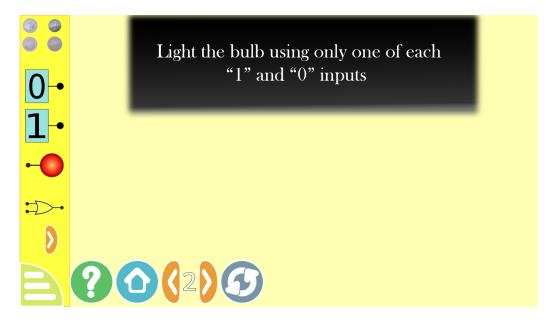

Figure 4: Digital Electricity: Basics

The second part will take the previous concepts a bit further and will ask the child to solve a simple problem using the component, maybe reusing it more than once. This will allow the child to get an in-depth understanding on how to use the component and what its purpose are. For example, for the Or Gate, the child will be asked to light the bulb from three power sources, such that the bulb should be on if at least one of the power sources is turned on

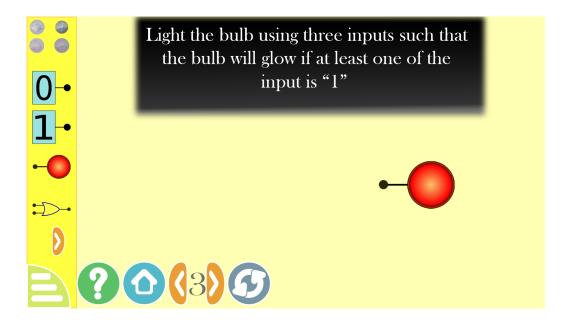

Figure 5: Digital Electricity: Second Step

The third part will ask the child to complete a given incomplete circuit, making use of the component and the previously learned components. It will ask the child to complete the circuit with limited number of the provided components

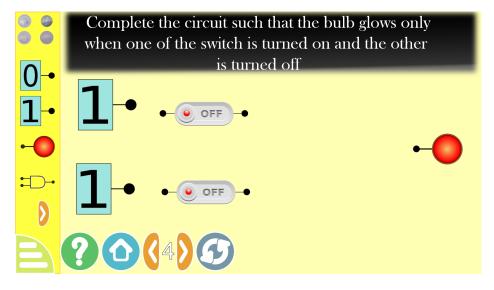

Figure 6: Digital Electricity: Third Step

- The final answers for each of the above levels will be validated using an "ok" button
- Whenever there is a level where a specific item is used for the first time, there will be an instruction text to inform the children on what the specific component does and how to operate it

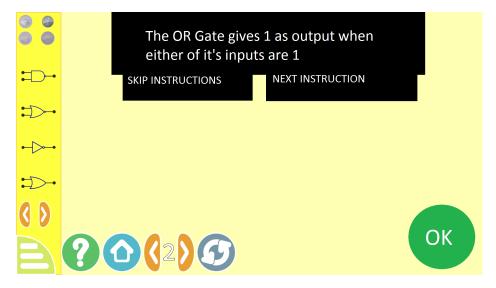

Figure 7: Digital Electricity: Instructions

- There will be a free mode, as it is present in the current implementation of the activity, where the child can try out any combination of circuits and test it. This free mode will be present after the levels are over, once the child has understood the concepts of each and every components and how to use it
- For small screen devices like tablets and phones, it is uneasy to select the tools (delete, rotate left, rotate right and info). To improve this, I will be adding them on a ListView, which can be expanded and collapsed when the "Tools" option is clicked
- Since the basic simulation is already done in the current progress of the activity, I can directly move on to the coding part, implementing the different levels for the activity

4. Timeline

May 5, 2017 - May 30, 2017: Community Bonding Period

- I will interact and consult with my mentors.
- I will take an in-depth look at the implementation of the activities in my proposal, discussing about the same with my mentors, so as to devise an optimum method to implement the proposed tasks.
- I will look up the documentations and learn about box2d, the physics engine I will be using for the submarine activity
- I will look for the necessary resources (images and audio clips) required for my proposed projects.

May 31, 2017 - July 10, 2017: Pilot a Submarine

- May 31 June 5: Basic Structure, Instructions
 - Implement the basic layout of the activity, which includes the submarine itself, the surrounding environment, the gates, the colliders such as the rocks and ships. Also, include the basic components of the submarine: the engine, rudders and air tanks.

 Create tutorials for the activity: explaining the use of the components of the submarine (engine, rudders and the air tanks) and the goal of the activity.

Milestone to be reviewed

- Review the basic layout and the tutorials of the activity
- June 6 June 20: Movement, Physics, Collisions and animations
 - Implement basic movement of the submarine, physics and collision handling of the submarine using box2d
 - Detect pickups, game over and successful level completion
 - Implement animations of submarine

Milestone to be reviewed

- The movement, controls, physics, collisions and animations. Changes will be made if necessary
- June 21 June 30: Implement levels with difficulty
 - Implement different levels while maintaining a proper difficulty curve

Milestone to be reviewed

- Review the levels and their difficulty. Changes will be made if necessary to create a proper balance in the difficulty in the levels
- July 1 July 10: Testing and bug fixing
 - Test the activity on various platforms and screen sizes
 - Get reviews for the overall activity from my mentors
 - Make necessary changes based on the reviews from my mentors

July 11, 2017 - July 31, 2017: Family

• July 11 - July 18: Improve layouts

Change the layout of the activity to make sure that the implementation is clean and doesn't override other components of the activity

Milestone to be reviewed

- Review the layout of the activity and make changes if necessary

• July 19 - July 25: Implement sub-levels

 Implement sub-levels: given a relation, the user will have to click on a pair which satisfies the given relation

Milestone to be reviewed

 Review the new sub-levels from my mentors and make necessary changes

• July 26 - July 31: Testing

- Test the activity on various platforms and screen sizes
- Rigorous testing of the overall activity for various corner cases which may break the workflow of the activity, analysing and fixing the bugs
- Get reviews for the overall activity from my mentor
- Make the necessary changes based on the reviews from my mentors

August 1, 2017 - August 21, 2017: Digital Electricity

• August 1 - August 5: Initial levels, Instructions

- Fix tools icon being too small for devices with small screen size by implementing the expandable and collapsible ListView
- Create the initial tutorial levels which are aimed at teaching the basic workings of the components
- Display the instructions at the beginning of the levels where a new component is used for the first time

Milestone to be reviewed

 Review the initial levels, tutorials and instructions and make the necessary changes to make the concepts easier to understand for newcomers

• August 6 - August 17: Implement levels with difficulty

- Provide a specific problem to the user and ask them to solve it using only specific number of components
- Implement restricting the number of components that can be used per level to that specified in the level
- Checking the resultant circuit arrangement after the "ok" button is clicked, and display the result to the user.
- Move the existing free mode in the end as the last level, when all the previous level are completed by the user

Milestone to be reviewed

 Review the levels and its difficulty and make changes if necessary to adjust the difficulty of the levels

• August 18 - August 21: Testing

- Testing the activity on various platforms and screen sizes
- Rigorous testing of the overall activity for various corner cases which may break the workflow of the activity, analysing and fixing the bugs

Milestone to be reviewed

 Review of the overall activity, especially on various devices and screen sizes

• August 22 - August 29: Review

- Get reviews from my mentors on the overall activity
- Make necessary changes based on the reviews
- Submit the code for final evaluation

Other commitments

- I will be having exams from June 1st to June 15th. During that timeline, I will be able to work 3 hours per day
- I might be out of station from July 10th to 16th. I will be able to work in my free time, giving around 6 hours per day
- During the rest of the period, I will be able to work 8-10 hours per day

5. About Me

I am a third year undergraduate engineering student from Maulana Abul Kalam Azad University of Technology (formerly known as West Bengal University of Technology), pursuing B.Tech in Computer Science and Engineering. I have been contributing to KDE for the past few months on the Qt version of GCompris, which helped me to get familiar with Qt and the overall GCompris codebase.

My contributions on GCompris include:

- Display the characters attempted by the user in the Hangman activity https://github.com/gcompris/GCompris-qt/commit/ 8ab75acf49431c685021f3cd0e58cf31f3fa4568
- Adding a Directory class in Core to directly get a list of all files in a given directory

https://github.com/gcompris/GCompris-qt/commit/955462b943c34fc130d1a68fcfb0e1ec6393a3f0

• Improve the algorithm to add new levels in the categorization activity, so that we do not need to change the code while adding new levels. Also, added odd-even category in the categorization activity

https://github.com/gcompris/GCompris-qt/commit/db7a4a9b743a3521c7c68f0b2b54719cbc9582db

• Display a black point in drawletters and drawnumbers activity whenever a line cannot be drawn for a given input

https://github.com/gcompris/GCompris-qt/commit/eaf8dd326dd3f5581995155739be5c72af744f92

- Under review: Ordering activity, which aims at arranging numbers and alphabets in it's increasing or decreasing order https://github.com/gcompris/GCompris-qt/pull/172
- Under review: Allow only certain activities to take part in the expert mode of categorization activity
 https://github.com/gcompris/GCompris-qt/pull/181
- Added images to the word dataset of geompris, which is used in the odd-even category of the categorization activity
 github.com/geompris/GCompris-words/tree/master/words/numbers

I am also the head of our college's programming club, where we create awareness about open source and encourage newcomers to take part in open source contribution.

Some of my other open source projects include contributing to Algorithm Visualizer (github.com/parkjs814/AlgorithmVisualizer), Battery Manager (github.com/BytesClub/Battery-Manager), Simulator (github.com/BytesClub/Simulator) and few video game projects which I build during my free time, namely: Followed (github.com/RudraNilBasu/

AsylumJam2016), Fortior (github.com/RudraNilBasu/Fortior) and a Quiz game (github.com/RudraNilBasu/Quiz-Game) to name a few.

All of my open source projects can be found on my Github profile: github.com/RudraNilBasu

Besides this, I have actively taken part in online and offline programming competitions, hackathons and have been involved in video game development, taking part in numerous online and offline game jams.
